EXPERIENCE

Software Engineer in Developer Experience

Databricks

Amsterdam, Netherlands · Sep 2025 – Present

- Decreased the number of **engineers blocked every day** due to development environment startup failures by **4x**, across all ~3,000 engineers at the company. Built the missing instrumentation from scratch on Databricks itself, then worked through the most common failures, fixing both the client side in Scala and the remote setup in Go.
- Reduced how long engineers wait for improvements to Databricks' internal development environment system, from **5 days to 2.5**, and increased release frequency from twice a week to daily, with **no increase in rollbacks or incidents**. Redesigning a single Spinnaker pipeline into two: one that bakes and tests machine images every 4 hours, and one that ships the last known good build to all users daily.
- Lowered read traffic to GitHub from **~80 GB/hour to ~0.1 GB/hour** by moving 30 CI workloads onto an internal Git caching layer. This was part of a broader migration that brought down P90 git push latency from 60 to 30 seconds across all Databricks engineers.
- Owned observability** for the internal Git caching layer serving ~3M requests per day across multiple repositories, including Databricks' biggest monorepo (over 1 million files). Defined the service's SLOs and built multi-window, multi-burn-rate alerting on Prometheus and Grafana, along with the dashboards and runbook the team uses for on-call.
- Cut the time to detect and escalate GitHub-side incidents from ~2 hours to under 10 minutes, often **before GitHub flagged them to us**, by building monitoring that tells on-call whether the failure is in our service or at GitHub. Detection previously relied on engineers reporting slow Git operations.

Software Development Engineer Intern

Amazon

Iași, Romania · Jul 2024 – Oct 2024

- Made it faster and easier for data engineering teams in Amazon's compliance department to find metadata about jobs, tables, and dashboards, by replacing a set of older, scattered internal tools with a single web application. **Talked to the users myself** to understand their workflows before deciding what to build.
- Built and deployed the full serverless web application **to production** on AWS, using CloudFront, API Gateway, Lambda, and DynamoDB, with infrastructure as code in CloudFormation.

Computer Science Tutor

Private Tutoring

Romania · Mar 2023 – Jul 2025

- Took a student from failing to qualify for the Romanian National Computer Science Olympiad to winning a **bronze medal** there the next year.
- Taught computer science one-on-one to **12 students**, covering competitive programming and university admission preparation ([Trustpilot reviews](#)).

SKILLS

- Go | Scala | Rust | Python | TypeScript | Java | C++ | SQL | Bash | Node.js | React
- AWS | Azure Databricks | Kubernetes | Docker | Bazel | Terraform | CloudFormation | Linux | Ansible
- Git | GitHub Actions | Spinnaker | Prometheus | Grafana | Protobuf | PostgreSQL | DynamoDB | S3
- Distributed Systems | Microservices | Backend | DevOps | CI/CD | gRPC | REST | SRE | Observability | SLOs

EDUCATION

Bachelor in Computer Science

- Babeș-Bolyai University** of Cluj-Napoca, Romania
- Oct 2025 – Present** | Expected Graduation Jul 2028
- Relevant Courses:** Data Structures and Algorithms | Object-Oriented Programming | Operating Systems | Computer System Architecture

ACHIEVEMENTS

- Bronze Medal**, Romanian National Computer Science Olympiad (Apr 2022)

- **First Ascent, Bending Spoons:** selected as one of Romania's top 20 computer science students for a three-day fully funded event at the company's HQ in Milan, Italy (Jun 2024)
